

Functional Guidelines for Evaluating Organic Analysis

CASE No.: 40262
LABORATORY: Mitkem

SDG No.: B7GB3
SITE: Riverside Avenue
ANALYSIS: 13 (W) BNA

DATA ASSESSMENT

The current SOP HW-35/SVOA (Revision 1) August, 2007, USEPA Region II Data Validation SOP for Statement of Work SOM01.2 for evaluating organic data have been applied.

All data are valid and acceptable except those analytes rejected "R"(unusable). Due to the detection of QC problems, some analytes may have the "J" (estimated), "N"(presumptive evidence for the presence of the material, "U" (non-detect) or "JN" (presumptive evidence for the presence of the material at an estimated value) flag. All action is detailed on the attached sheets.

The "R" flag means that the associated value is unusable. In other words, significant data bias is evident and the reported analyte concentration is unreliable.

Reviewer's

Signature: Israel Okwuonu

Date: December 23, 2013

Verified By: _____

Date: _____ / _____ /2010

1. HOLDING TIME:

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detects (sample quantitation limits) will be flagged as estimated, "J", or unusable, "R", if the holding times are grossly exceeded.

The following action was taken in the samples and analytes shown due to excessive holding time.

The following semi-volatile water samples are outside primary extraction holding time criteria. Detected compounds are qualified J. Non-detected compounds are qualified UJ.

B7GB6RX

2. DMC/SURROGATES

All samples are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. If the measured surrogate concentrations were outside contract specifications, qualifications were applied to the samples and analytes as shown below.

The following semi-volatile samples have deuterated monitoring compound recovery below the lower limit of the criteria window. Detected compounds are qualified J. Non-detected compounds are qualified UJ.

Pyrene-d10

B7GB6: Benzo(a)anthracene, Chrysene, Fluoranthene, Pyrene

Anthracene-d10

B7GB6: Anthracene, Atrazine, Hexachlorobenzene, Phenanthrene

Benzo (a) pyrene-d12

B7GB6: Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Indeno(1,2,3-cd)pyrene

Fluorene-d10

B7GB6RX: 4-Bromophenyl-phenylether, 4-Chlorophenyl-phenylether, Carbazole, Dibenzofuran, Fluorene

Dimethylphthalate-d6

B7GB6RX: 1,1'-Biphenyl, Bis(2-Ethylhexyl)phthalate, Butylbenzylphthalate, Caprolactam, Di-n-butylphthalate, Di-n-octylphthalate, Diethylphthalate, Dimethylphthalate

Acenaphthylene-d8

B7GB6, B7GB6RX: 2-Chloronaphthalene, 2-Methylnaphthalene, Acenaphthene, Acenaphthylene, Naphthalene

3. MATRIX SPIKE/SPIKE DUPLICATE, MS/MSD:

The MS/MSD data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD may be used in conjunction with other QC criteria for additional qualification of data.

Not applicable

4. BLANK CONTAMINATION:

Quality assurance (QA) blanks, i.e., method, field, or rinse blanks are prepared to identify any contamination, which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Field and rinse blanks measure cross-contamination of samples during field operations. Depending on the concentration of the analyte in the blank, the analytes are qualified as non-detects, "U".

The following analytes in the sample shown were qualified with "U" for these reasons:

A) Method blank contamination:

No problem found

B) Field or rinse blank contamination:

None associated with the samples

C) Tics "R" rejected:

The following Tics have been rejected "R". Their concentration is five times (5x) less Than the associated method blank concentration.

No problem found

5. MASS SPECTROMETER TUNING:

Tuning and performance criteria are established to ensure adequate mass resolution, proper identification of compounds and to some degree, sufficient instrument sensitivity. These criteria are not sample specific. Instrument performance is determined using standard materials. Therefore, these criteria should be met in all circumstances. The tuning standard for volatile organics is (BFB) Bromofluorobenzene and for semi-volatiles Decafluorotriphenyl-phosphine (DFTPP). If the mass calibration is in error, all associated data will be classified as unusable "R".

No problem found

6. CALIBRATION:

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of giving acceptable performance at the beginning of an experimental sequence. The continuing calibration checks document that the instrument is giving satisfactory daily performance.

A) Response Factor GC/MS:

The response factor measures the instrument's response to specific chemical compounds. The response factor for the Target Compound List (TCL) must be ≥ 0.05 in both initial and continuing calibrations. A value < 0.05 indicates a serious detection and quantitation problem (poor sensitivity). Analytes detected in the sample will be qualified as estimated, "J". All non-detects for that compound will be rejected "R".

The following semi-volatile samples are associated with a CCV with relative response factors (RRF50) outside criteria. Detected compounds are qualified J. Non-detected compounds are qualified R.

2,4-Dinitrophenol : B7GB4RE, B7GC2, B7GC4, B7GC5, B7GC6

Pentachlorophenol: B7GB4RE, B7GC2, B7GC4, B7GC5, B7GC6

7. Percent Relative Standard Deviation (%RSD) and Percent Difference (%D):

Percent RSD is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent D compares the response factor of the continuing calibration check to the mean response factor (RRF) from the initial calibration. Percent D is a measure of the instrument's daily performance. Percent RSD must be $< 20\%$ and 40% for poor performers while %D must be $< 25\%$ and 40% . A value outside of these limits indicates potential detection and quantitation errors. For these reasons, all positive results are flagged as estimated, "J" and non-detects are flagged "UJ". If %RSD and %D grossly exceed QC criteria, non-detects data may be qualified "R".

The following analytes in the sample shown were qualified for %RSD and %D:

The following semi-volatile samples are associated with an opening or closing CCV percent difference (%D) outside criteria. Detected compounds are qualified J. Non-detected compounds are qualified UJ.

Di-n-octylphthalate: B7GB3, B7GB4, B7GB5, B7GB6, B7GB8, B7GB9, B7GC0, B7GC1, B7GC3

Benzo (g,h,i) perylene: B7GB6RX, SBLK2K

Indeno (1,2,3-cd) pyrene: B7GB6RX, SBLK2K

Benzo (k) fluoranthene: B7GB6RX, SBLK2K

2,4-Dinitrophenol: B7GB4RE, B7GC2, B7GC4, B7GC5, B7GC6

Pentachlorophenol: B7GB3, B7GB4, B7GB4RE, B7GB5, B7GB6, B7GB8, B7GB9, B7GC0, B7GC1, B7GC2, B7GC3, B7GC4, B7GC5, B7GC6

8. INTERNAL STANDARDS PERFORMANCE GC/MS:

Internal standards (IS) performance criteria ensure that the GC/MS sensitivity and response are stable during every experimental run. The internal standard area count must not vary by more than a factor of 2 (-50% to +100%) from the associated continuing calibration standard. The retention time of the internal standard must not vary more than \pm 30 seconds from the associated continuing calibration standard. If the area count is outside the (-50% to +100%) range of the associated standard, all of the positive results for compounds quantitated using that IS are qualified as estimated, "J", and all non-detects as "UJ", or "R" if there is a severe loss of sensitivity.

If an internal standard retention time varies by more than 30 seconds, the reviewer will use professional judgment to determine either partial or total rejection of the data for that sample fraction.

No problem found for this qualification

9. COMPOUND IDENTIFICATION:

A) Semi-Volatile Fractions:

TCL compounds are identified on the GC/MS by using the analyte's relative retention time (RRT) and by comparison to the ion spectra obtained from known standards. For the results to be a positive hit, the sample peak must be within \pm 0.06 RRT units of the standard compound and have ion spectra which have a ratio of the primary and secondary m/e intensities within 20% of that in the standard compound. For the tentatively identified compounds (TIC) the ion spectra must match accurately. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications.

No problem found

10. CONTRACT PROBLEMS NON-COMPLIANCE: No problems found.

11. FIELD DOCUMENTATION: No problems found.

12. OTHER PROBLEMS:

None found

13. This package contains reextractions, reanalyses or dilutions, upon reviewing the QA results, the following Form 1(s) are identified NOT to be used.

B8GB4RE, B7GB6RX
